2014 ESC/EACTS Guidelines on myocardial revascularization

The Task Force on Myocardial Revascularization of the European Society of Cardiology (ESC) and the European Association for Cardio-Thoracic Surgery (EACTS)

Developed with the special contribution of the European Association of Percutaneous Cardiovascular Interventions (EAPCI)

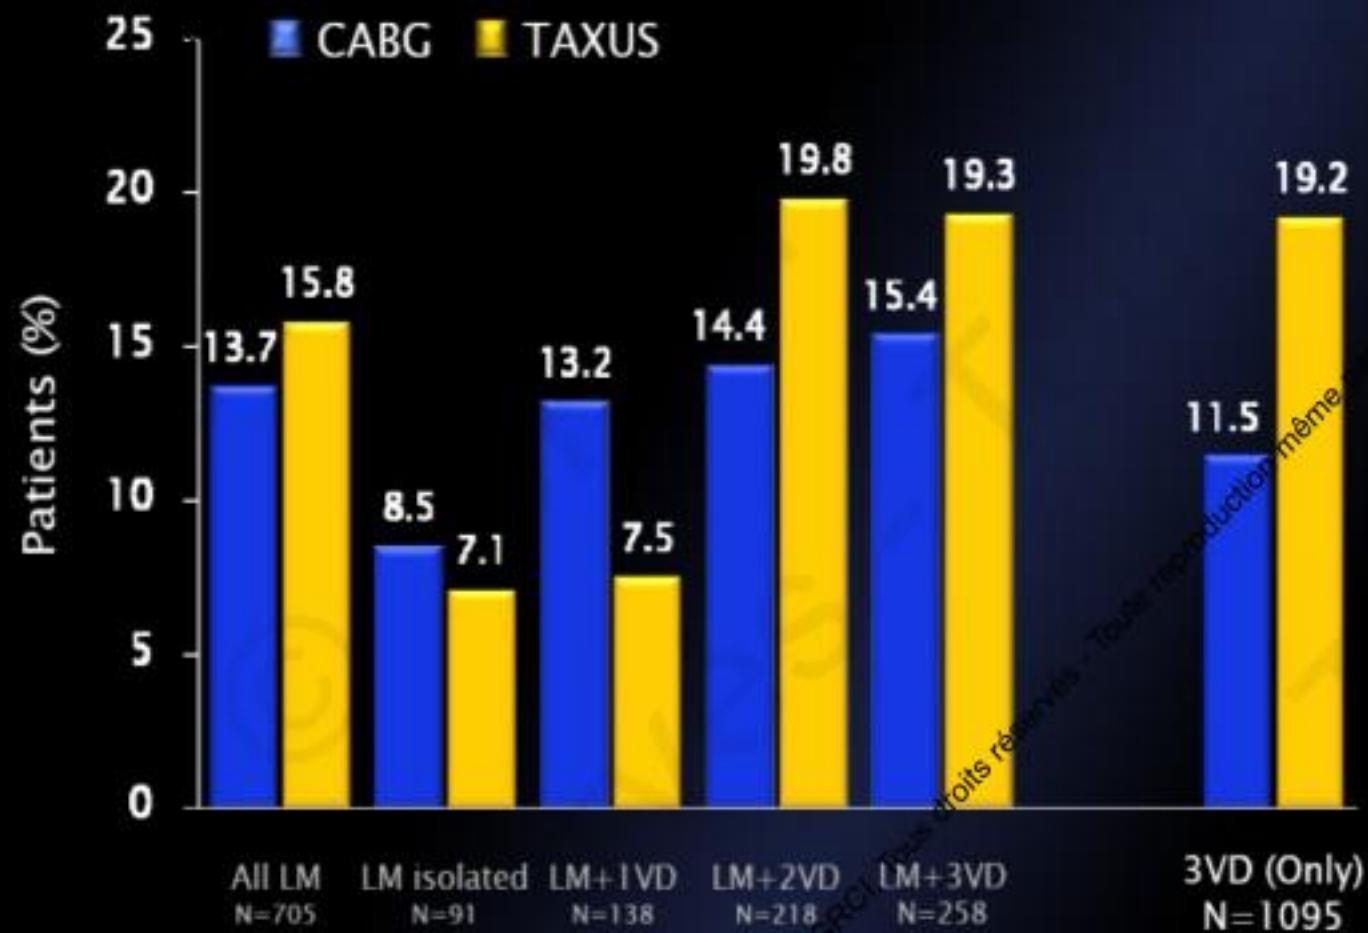

Indications for revascularization in patients with stable angina or silent ischaemia

Extent of CAD (anatomical and/or functional)		Class ^b	Level ^c
For prognosis	Left main disease with stenosis >50% ^a	I	A
	Any proximal LAD stenosis >50% ^a	I	A
	Two-vessel or three-vessel disease with stenosis > 50% ^a with impaired LV function (LVEF<40%) ^a	I	A
	Large area of ischaemia (>10% LV)	I	B
	Single remaining patent coronary artery with stenosis >50% ^a	I	C
For symptoms	Any coronary stenosis >50% ^a in the presence of limiting angina or angina equivalent, unresponsive to medical therapy	I	A

CAD = coronary artery disease; FFR = fractional flow reserve; LAD = left anterior descending coronary artery; LV = left ventricular.

^aWith documented ischaemia or FFR ≤ 0.80 for diameter stenosis <90%.

Cardiovascular death	9 (0.9)	12 (1.3)	73 (10.9)	52 (6.8)	75	55	0.12

* P values were calculated with the use of the log-rank test on the basis of all available follow-up data (i.e., more than 5 years).

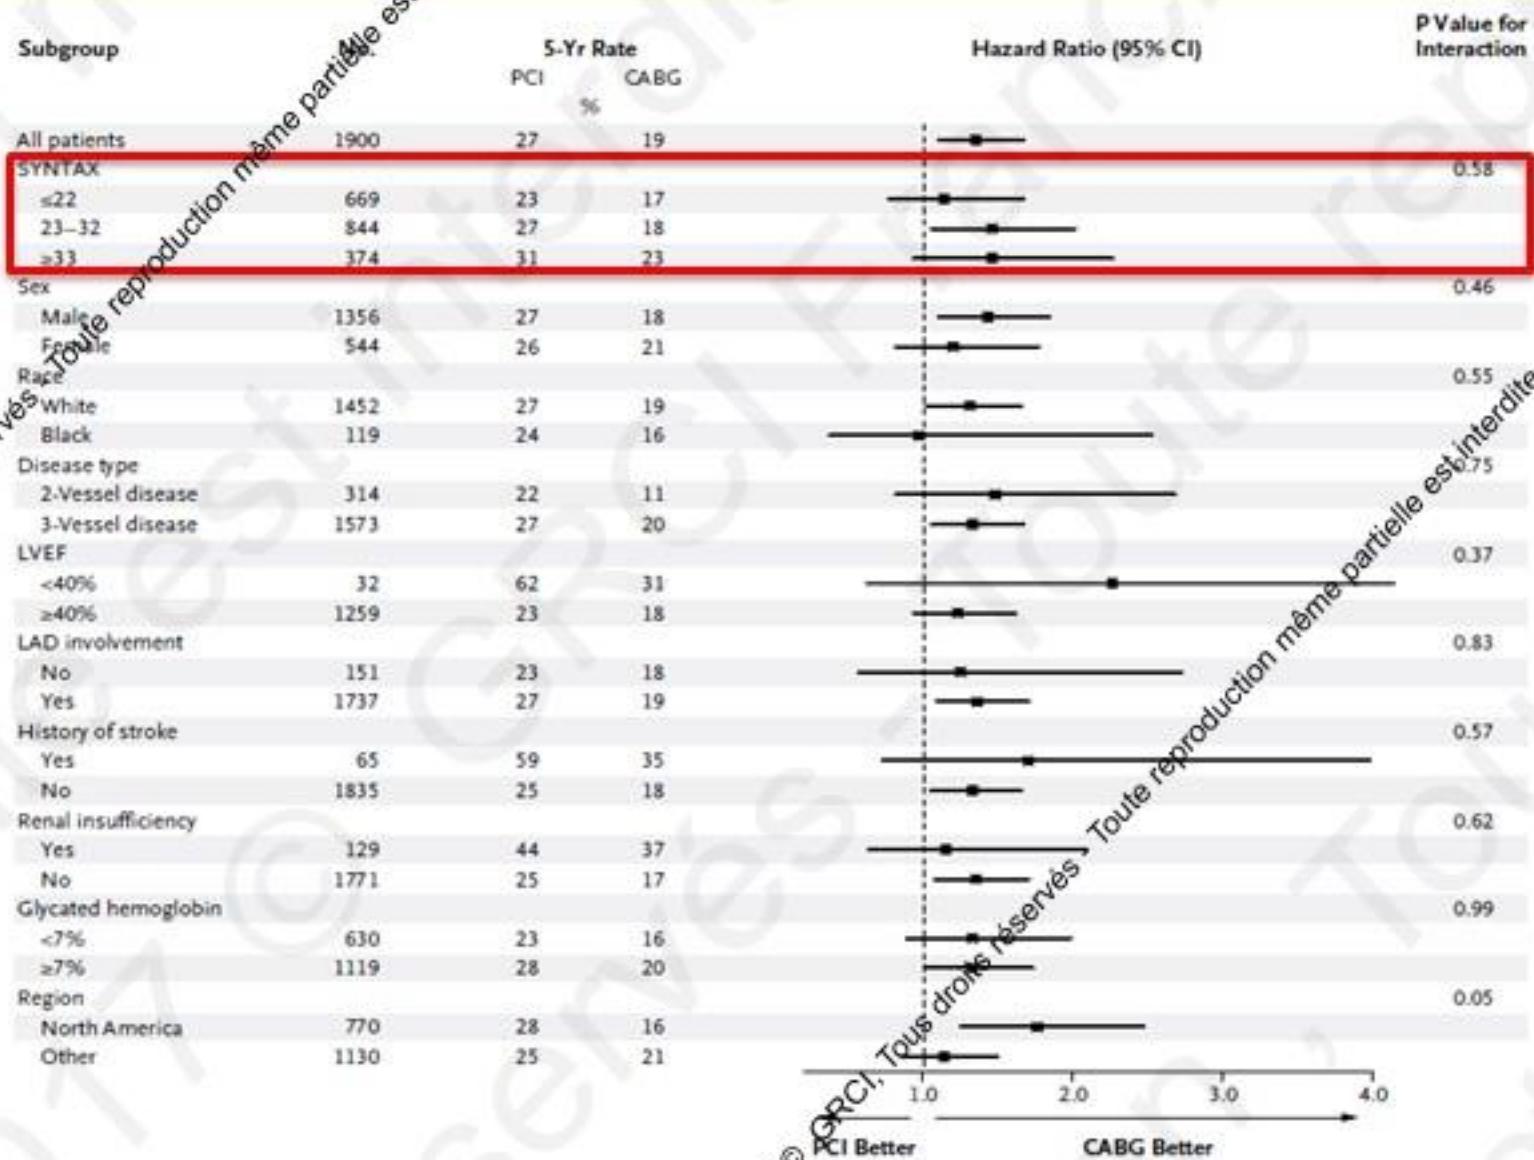

† The primary composite outcome was the rate of death from any cause, myocardial infarction, or stroke.

‡ P=0.006 in the as-treated (non-intention-to-treat) analysis.

§ P=0.16 by the Wald test of the Cox regression estimate for study-group assignment in 1712 patients after adjustment for the average glucose level after the procedure.

ET LE DIABETIQUE...?

Passion Communication Education

Specific recommendations for revascularization in patients with diabetes

Recommendations	Class ^a	Level ^b	Ref ^c
In patients presenting with STEMI, primary PCI is recommended over fibrinolysis if it can be performed within recommended time limits.	I	A	363
In patients with NSTE-ACS, an early invasive strategy is recommended over non-invasive management.	I	A	180,338, 364–366
In stable patients with multivessel CAD and/or evidence of ischaemia, revascularization is indicated in order to reduce cardiac adverse events.	I	B	93,367
In patients with stable multivessel CAD and an acceptable surgical risk, CABG is recommended over PCI.	I	A	106,175,249
In patients with stable multivessel CAD and SYNTAX score ≤22, PCI should be considered as alternative to CABG.	IIa	B	346,350
New-generation DES are recommended over BMS.	I	C	351,352
Bilateral mammary artery grafting should be considered.	IIa	B	368
In patients on metformin, renal function should be carefully monitored for 2 to 3 days after coronary angiography/PCI.	III	C
